

Flyme Ceylon

Business Requirements Document

Client	Flyme Ceylon
Prepared by	Voshana Nissanka
Date	11 July 2026
Status	Draft v0.1 — for discussion, not yet agreed with client

Contents

1. Purpose of this document

This document takes the project brief Flyme Ceylon shared and turns it into something a development team could actually build from. I've kept the original scope intact, added the questions I think need answers before we can commit to a timeline or a price, and suggested how I'd sequence the work.

It's still a draft. The real version of this gets written after the discovery conversation with the founder, not before.

2. Business overview

Flyme Ceylon is a six-month-old company running scenic flight tours over Sri Lanka. Four products are currently on offer.

Colombo scenic flights

A one-hour flight over Colombo's skyline and coastal towns. Passenger capacity depends on which aircraft is flying that day.

Sri Pada scenic flights

A two-hour flight over Adam's Peak, usually timed around sunrise or sunset, with the option to offer pilgrimage from the air.

Galle coastal tours

A flight along the southern coastline, taking in the fishing boats and the coastline near Galle.

Helicopter tours

Short 15- or 30-minute helicopter flights, generally aimed at couples or small groups.

3. What the client has asked for

Four requests came through in the initial brief:

1. A website that gives Flyme Ceylon an online presence — information, pricing, contact details — built to convert visitors into bookings, not just inform them.
2. A booking portal where customers pick a tour, date, and time, see what's actually available, pay online, and receive a confirmation email with flight details and a wallet pass or ticket.
3. A business enquiry channel for corporate customers wanting multiple flights or joint tours.
4. Social media outreach: ads on Facebook, Instagram, and TikTok, plus the creative assets to run them.

That last one is worth flagging early. It's a marketing service, not a piece of software. I'd want to separate it out from the SaaS build conversation so it doesn't quietly inflate scope or cost without anyone noticing.

4. Objectives

Beyond the feature list, here's what I think we're actually trying to achieve:

- Give Flyme Ceylon a professional web presence that builds trust with tourists who've never heard of the company.
- Move booking away from manual channels so the founder isn't the bottleneck for every sale.
- Open a proper channel for corporate and group bookings, which are likely higher value than individual tourist bookings.

- Support paid marketing with content that's actually built for the platforms it runs on.

5. Proposed scope

Given this is a young company with, presumably, a limited budget, I'd push for an MVP rather than building all four requests at once.

Phase 1: MVP

- Marketing website — home, tour pages, pricing, contact, about.
- Booking portal — tour selection, live availability by date, online payment, confirmation email, digital ticket or wallet pass.
- A basic admin panel so someone at Flyme Ceylon can manage availability and see bookings without emailing a developer every time a slot needs blocking off.

Phase 2

- Business enquiry portal, ideally with some lightweight tracking so enquiries don't get lost in an inbox.
- Social media content and ad management.

Parked for now, pending discussion

- A dedicated mobile app. The website should be mobile-responsive regardless, so a native app is a nice-to-have until there's evidence it's actually needed.
- Loyalty or repeat-customer programs.
- Expansion beyond Sri Lanka.

6. Stakeholders

Flyme Ceylon founder is the client and the final decision-maker on scope and budget.

Flyme Ceylon operations staff will be the day-to-day users of the admin panel.

Voshana Nissanka: business analyst and project lead.

Development team: to be brought on once scope is agreed.

End customers cover both individual tourists booking scenic flights and corporate or group customers using the enquiry channel.

7. Functional requirements

7.1 Website

The site needs to list all four tour types with pricing, duration, and what's included. It should have a clear path from browsing to booking — the brief specifically calls out conversion, so the design needs to support that, not just look nice. Contact details and business information should be easy to find, since trust matters more than usual when someone's about to get in a small aircraft with a company they found online.

7.2 Booking portal

Customers need to select a tour, see which dates and times have open slots, choose the number of passengers, and pay online. After payment, the system sends a confirmation email with flight details and a ticket. I still need to confirm with the founder whether "wallet pass" means an actual Apple or Google Wallet pass, or just a nicely formatted PDF — those are very different builds.

Passenger details need to be captured at booking. For the helicopter tours especially, passenger weight is often a real operational constraint, not just a data field. Whether ID or passport details are required depends on how Flyme Ceylon's operations currently handle manifests, which I don't know yet.

7.3 Business enquiry portal

This covers corporate customers wanting multiple flights or joint tours. At minimum it needs to capture the enquiry and route it to someone at Flyme Ceylon. Whether it needs a full quoting workflow or can just be a smart contact form depends on how many of these enquiries the business actually expects.

7.4 Admin panel

Not in the original brief, but necessary. Someone needs to open and close availability, block out dates for weather or maintenance, see who's booked on which flight, and process refunds. None of this was mentioned, which likely means it's being handled manually today. Worth raising directly with the founder, because this is probably a bigger piece of work than the booking portal itself.

7.5 Marketing

Social ads across Facebook, Instagram, and TikTok, with creative assets produced for each. This is a recurring service rather than a one-time build, and probably shouldn't be priced or staffed the same way as the software work.

8. Non-functional requirements

The site and portal need to work well on mobile, since most tourists will be browsing and booking from their phones. Payment handling needs to support international cards given the tourist customer base, and ideally more than one currency so pricing doesn't look like a rough conversion. Flights can get cancelled for weather, so the system needs to handle rebooking and refunds cleanly rather than as a manual workaround. None of this was in the original brief, but it becomes obvious the moment you think about who's actually using this and why.

9. Assumptions

The brief doesn't cover these, so I'm working from the following assumptions for now. All of them need confirming.

- There's no existing booking or CRM system in place, so this is a build rather than a migration.
- Flights currently get booked over phone, WhatsApp, or in person.
- Flyme Ceylon operates from one or two departure points, not several.
- Budget and timeline haven't been fixed yet.

10. Questions to raise with the client

Grouped by theme so the conversation doesn't turn into a scattergun of questions.

Commercial

- How is pricing structured — per person, per flight, group rates?
- What currency should the site quote in, and does it need to support more than one for tourists?
- What's the cancellation and refund policy, especially for weather-related cancellations?

Operations

- How many aircraft and pilots does Flyme Ceylon currently have, and what's the real capacity per time slot?
- How is availability tracked today?
- How many departure locations are there across the four tour types?

Booking portal

- Are scenic flights shared between strangers, or private charter only? This changes the entire booking logic.
- What passenger information is required at checkout, particularly around weight limits for the helicopter tours?
- Does "wallet pass" mean an actual Apple or Google Wallet integration, or a PDF ticket?
- Should there be a waitlist when a slot is full?

Business enquiry portal

- Is this a simple contact form, or does it need a quoting and follow-up workflow?

Admin

- Who manages bookings and availability day to day, and how many people need access?
- What level of reporting does the founder actually want — bookings per week, revenue, no-shows?

Marketing

- Is the social media work part of this project's scope, or a separate engagement?
- Who's producing the photo and video content? Is that assumed to already exist?

Constraints

- What's the budget range and target launch date?
- Are there existing brand assets — logo, photography, domain — or does that need to be built too?

11. Risks

- Bundling four fairly different deliverables (website, booking system, enquiry channel, marketing) into one brief makes it easy to lose track of what's actually MVP. Worth pinning down scope hard before quoting anything.
- Weather cancellations are inherent to this business. If the booking and refund flow doesn't handle that gracefully, it will generate support headaches and bad reviews fast.
- No admin system exists in the brief, which means it will likely get treated as an afterthought unless it's scoped explicitly now.
- Payment and passenger data for a young aviation business may carry compliance requirements, such as safety waivers or PCI rules for payments, that haven't been considered yet.

12. Recommended approach

Roughly the order I'd follow from here:

5. Discovery workshop with the founder — walk through the open questions above and get a clear picture of how bookings work today.

6. Write up a proper requirements document once those answers are in, with user stories and acceptance criteria per feature.
7. Prioritise using MoSCoW so we're not trying to build all four workstreams at once.
8. Map the customer journey: a tourist booking a flight, a corporate customer sending an enquiry, staff managing a day's schedule.
9. Sketch the site and portal structure — sitemap and user flows — before touching visual design.
10. Build low-fidelity wireframes for the core screens: homepage, tour selection, checkout, admin calendar.
11. Turn those into a clickable prototype in Figma, focused especially on the booking flow, since that's where the money is.
12. Review the prototype with the founder and get sign-off before development starts. This is the cheapest point to catch problems.
13. Scope the technical build (payment gateway, hosting, wallet pass integration) and put together a proper cost and timeline estimate.
14. Build, test, and launch in phases, starting with the MVP.
15. After launch, put analytics in place and treat the enquiry portal and marketing work as a second phase rather than launching everything at once.

13. Next steps

- Book the discovery session with the founder.
- Walk through section 10 of this document and get answers.
- Agree on MVP scope and a rough budget range.
- Move into wireframes once scope is locked.
